Appendix

Goals and strategies in the 2026 Iran War

US: From regime compliance to managed US exit

Regime compliance as initial primary goal...

- The US initially sought to coerce Iranian acquiescence on Big 3 demands (zero enrichment, missiles, proxies).

Focus has since shifted to the Strait of Hormuz (SoH) reopening, the nuclear file, thus softening war goals.

- ... US instruments of choice have increasingly shifted toward less kinetic measures (e.g. circumvention, sanctions, blockade).
- The intensity and scope with which the US applies these non-kinetic measures remains a source of leverage.

Economic costs, war damage and overreach pushes the US toward and offramp

- Oscillating public statements by President Trump indicate growing frustration, if not desperation.
- A feasible exit including concessions to Iran has significant strategic – and domestic political consequences.
- Escalation remains risky absent limited means to offset Iranian capabilities and growing initiative-taking.

A return to fighting remains an option but carries significant regional risks amid reports of Iranian military reconstitution.

Iran: Regime security

“Collective cost’ and endurance

- Iran’s war strategy has been to raise the collateral cost of US and Israeli aggression.
- Iran looks to endure the blockade and war damage, hoping that the regional and global costs of disruptions rise faster than those in Iran.

An existential defensive war

- The regime perceives an existential threat to its survival, leading to perceived higher risk-taking.

Negotiations more likely if security guarantees and means to rebuild are achievable, to ensure regime stability

- So far, any US concessions appear too small or too easily reversible.

Status quo is undesirable, aggressive initiatives to follow

- Despite demonstrated resilience, economic damage is compounded with time
- Reports indicate more aggressive initiative-taking by Iranian forces could follow
- Renewed strikes, sabotage, and fomenting dissent in the region

Israel: Degradation and attrition

Despite ceasefire, degrading Iran’s military and political capabilities remains a key goal.

- Upshot in case of renewed war: A prolonged war that severely degrades, and possibly destabilizes the Iranian regime pose upside to Israeli national security

Regime change may have been an early political goal, albeit poorly executed

- Recent reporting and analysis indicate war planners may have sought to foment regime change ([INSS](#), [NYT](#))

Israel may have higher risk tolerance level than the US.

- Israel internalizes more of the gains of the war than the costs, evident by asset price responses.

Israel’s focus has shifted to Lebanon

- In Lebanon: a shift from targeted degradation toward indefinite territorial occupation and security zone establishment, with diplomacy as an instrument for the purpose of Hezbollah's dissolution.

Strategic achievements remain elusive

- Current IDF deployment and expected civilian collateral cost make full destruction of Hezbollah unlikely.
- Talks with the Lebanese government underway

Dynamics & What to Watch: Escalation risks

State of Conflict in Week 25

The way the Memorandum of Understanding (MoU) fell apart is testament to an inherent US inability to control outcomes in the Middle East

Continued pressure on energy markets

- Evident by the continued partial disruption of the SoH and the Bab El-Mandeb
- Global energy markets remain dependent on inventory draws, higher US oil exports and lower Chinese oil imports

The conflict has widened risking further intensification

- Fighting in Yemen risks reigniting a civil war.
- Gulf states remain vulnerable to attacks, with Saudi Arabia facing challenges from Iran-supported militias in both Iraq as well as Yemen
- The Iranian regime has undergone military- and security leadership changes which has been interpreted as cementing the view that
- Media reporting suggesting existing Iranian plans to escalate conflict if a negotiated outcome is not reached

The US vows tougher economic measures against Iran but faces constraints on further military action

An unstable equilibrium may unwind

Absent a diplomatic breakthrough, the prevailing geopolitical equilibrium in the Middle East has been inherently unstable.

The Iranian regime has demonstrated that it is willing to withstand the blockade for several ("six to eight") months...

- ... before pressure on the regime builds to the point where it could potentially be more amenable to concessions.

Centripetal forces imply risks of gravitation towards war

- The Iranian regime may come to perceive that a resumption of war is more in its interest rather than waiting for the blockade (SoH closure) to force it into more concessionary negotiations
- Absent durable diplomatic progress - the road to renewed conflict remains open and may be inversely correlated with the actual pressure on the Iranian regime going forward.
- Iranian demonstrated resilience coupled with perceived US strategic weakness risks emboldening the Iranian regime to exert greater military pressure in the region.

What to Watch / Open Questions

Trump's options

- Continuing the blockade, hoping costs materialize faster in Iran than in the global economy, even if it risks another round of fighting.
- Acquiescing to Iranian demands, accepting the new status quo, facilitating SoH reopening and alleviating market pressure, but with a strategic cost to US and allies in the region.
- Resuming the war, with greater risks and unclear means of achieving strategic achievements.

Israel's ongoing strikes in Lebanon raise two related questions:

- How far is Iran willing to go to shield Hezbollah from Israeli strikes?
- How much pressure is the US willing to put on Israel to secure a deal with Iran?

Is Iran overplaying its hand?

- Iran's newfound assertiveness may be a sign of limited US/Israeli escalation dominance but also a growing need to secure regime stability and acquire means to rebuild Iran's economic and military.
- The more commentators "highlight Trump's failings, the more likely it is that the US will seek to reverse the outcome of this war by waging another." (FT)

Iran vows offensive shift, US military faces supply problems

Iran taking the initiative?

- Arab intelligence officials told WSJ of a “strategic shift” inside Iran’s leadership “to get their forces ready to widen the war and raise the costs for the US.”
- “Tehran believes it has the military edge and is openly discussing going on the offensive instead of merely responding to American attacks.” (Trita Parsi on X).
- IRGC Dep. Political Commander Javani: Iranian operations “may become offensive” in the future and that “Iran’s enemies should prepare for Iranian strategic surprises.”
- A “gradual shift away from the strategy of ‘comprehensive defense’ toward ‘offensive deterrence’” (Mostafa Najafi on X)
- Renewed Houthi pressure in Yemen offers an early indication of a widening conflict more offensive form of Iranian deterrence could look like.
- “The greater the [US] economic pressure, the stronger the incentive [for Iranians] to initiate a new conflict. Sanctions are hurting, but they are unlikely to force the regime into a public surrender. Washington will have to choose between costly, unpredictable escalation and accepting Iran’s terms.” (Danny Citrinowitz on X)
- “Iranian attacks on shipping in the Strait of Hormuz are piling up without an American military response” (WSJ)
- WSJ sources Arab intelligence officers warning of “sabotage of internet cables in the Persian Gulf, creating political unrest in countries with Shia communities such as Kuwait and Bahrain, and potentially even ground operations in Kuwait”
- Iranian “regime insiders” told the FT that Iranian forces have assessed strikes on US bases in Europe, including Bulgaria and Cyprus

US leans on economic measures amid military limits

Leaning on economic measures

A “one-two punch” of measures with little detail so far – The US has promised new phase of economic pressure on Iran could reportedly include:

- ... more aggressively targeting the international financial and commercial networks that have helped Tehran keep selling oil despite decades of US pressure
- ... including Chinese banks, yuan-denominated payments for Iranian oil, alternative payment systems, and the shipping, insurance, refining, and financial intermediaries behind the trade
- .. one potentially powerful option would be to target financial jurisdictions and institutions that facilitate payments for sanctioned Iranian oil, such as Hong Kong

Munitions depletion, reduced base presence, and strained logistics

- Munitions drawdown has made further large-scale campaigns questionable, both strategically as well as tactically
- Reduced US base presence in the Persian Gulf - Iranian attacks on US air bases in the region, coupled with depleted air interceptors, limit forward posture
- A reduced base access inside the Persian Gulf and a limited US combat logistics fleet has strained supply problems for US forces in the region.

What do prediction markets say about the conflict?

Expectations of SoH reopening remain low

Prediction odds related to the Iran War

Scenarios: The Iran War in Three Months

Description: Right-hand table gauges different scenarios in three months time and their estimated associated Brent oil prices. The weighted average of these scenario price estimates are then compared with the three-month Brent oil futures price.

For more details see “Iran’s Survival Calculus, Institutional Entrenchment and the Limits of Decapitation,” SEB Geopolitical Update, Mar 1, 2026, <https://shorturl.at/ZXktv>

Iran War Scenario Outcomes and Implied Brent oil price in 3 months								
	Scenario prevailing in 3 months	Strait of Hormuz future	Iran acquires of nuclear weapons	Regime change in Iran?*	Continued disruption of energy infrastructure	Market outcomes	Oil price USD/b**	Estimated probability
Iran overcome	1 US and Israel jointly overwhelm Iran	Rapid return to normal levels	No	Unlikely	No	Positive despite initial increase in volatility; conflict risk premia dissipates in oil markets; strong recovery in regional equity markets	50-60	0.05
	Probability that Iran capitulates							0.05
Negotiations	2 Negotiations amid continued energy disruption	Large/moderate disruption	Possible	No	Yes	Pressure on energy markets intensity, supply chain disruption and demand destruction take a toll on market outcomes	75-95	0.1
	3 Negotiations amid energy normalization	Limited disruption	Possible	No	No	Positive, as the energy disruptions and bilateral Iran-US talks are compartmentalized	80-90	0.2
	Probability of negotiations							0.3
Continuation	4 Low-intense / unfinished conflict	Significant disruption	Yes	No	Threat of future strikes remain	Conflict risk premia remain in oil markets, uncertainty keeps regional stocks subdued, and elevated risk of future conflict	80-100	0.25
	5 Regime destabilization	Limited/moderate disruption	No	Possible	Limited by regime degradation	Conflict risk premia remain in oil markets, uncertainty keeps global and regional stocks subdued	90-100	0.1
	6 Renewed conflict	Large disruption	Yes	Unlikely	Yes	Large sustained disruption of energy and shipping markets	100-150	0.3
	Probability of prolonged conflict							0.65
Scenario-implied probabilities			0.70	0.18	0.47	Brent oil in 3m: scenario-weighted implied vs latest market price (USD/b)***	Implied: 97.8	Current: 85.2

Source: SEB. * Regime change here is assessed in the short run. Any scenario could potentially lead to changes in the regime in the longer term. ** These scenario-based oil prices indicate where the oil price is at the point of realization of a scenario and does not necessarily capture short-term volatility. ***The probabilistic Brent oil price is a weighted average of the mid-range oil price under the different scenarios and does not constitute a forecast. SEB's oil price forecasts are available at <https://research.sebgroup.com/macro-ficc>

Iran's Economy: Resilient Under Pressure

Who runs Iran now?

An August 2026 update reshuffled the SNSC: Zolghadr out, Rezaei in; and formalized military appointments.

Mojtaba Khamenei (MK)

Supreme Leader since March 2026

In hiding since start of war

Masoud Pezeshkian

President since 2024, handling day-to-day functions, limited influence over national security.

Independent, sometimes referred to as a reformist

Mohammad-Bagher Ghalibaf

Handling 'strategic matters'

Speaker of the Iranian parliament, Fmr. mayor of Tehran, IRGC commander.

Ahmad Vahidi

Handling 'military affairs'

Commander-in-chief of the IRGC since 2026, following death of predecessor

Mohsen Rezaei

Security coordinator

Appointed Secretary of the SNSC in August 2026

Council, fmr. Commander-in-chief of the IRGC

Mohammad Bagher Zolghadr

Political adviser to MK

Fmr.: secretary of SNSC, dep. Min of the interior; dep. commander of the IRGC and founder of the Ansar Hezbollah paramilitary organization.

Mehdi Khamoushi

M. Khamenei's Chief of Staff

Head of the Endowment and Charity Organization (Oghaf)

Family connections with MK and Ghalibaf

Gholam-Hossein Mohseni-Ejei

Chief Justice since 2021

Fmr. minister of Intelligence, fmr. Prosecutor-General of Iran

Co-ruled with A. Larijani and A. Arafati following death of Ali Khamenei

Hossein Taeb

'Regime power broker'

Recently appointed Basij leader

Politically influential cleric and fmr head of IRGC Intelligence & Basij.

Ali Abdollahi Aliabadi

Chief of Armed Forces and Khatam al-Anbiya Central Headquarters

One of the few military leaders to have had reported meetings with MK

Saeed Jalili

Far-right 'enfant terrible'

Ali Khamenei's appointee to SNSC, Council, former secretary of SNSC, fmr. nuclear negotiator

Hardliner, backed by far-right Islamic fundamentalists (Paydari)

Member of the Expediency Discernment Council

Member of the Supreme National Security Council

Cleric

Affiliation with the Islamic Revolutionary Guards Corps (IRGC)

Sardar (2nd Brig. General or higher)

Political system of the Islamic Republic of Iran

A New Supreme Leader I: Mojtaba Khamenei

Reportedly injured, IRGC ally,

- Relatively unknown, has not held public office before, reportedly injured from airstrike, served in the IRGC during the Iran-Iraq War.

IRGC expands influence

- His candidacy reportedly received support from the IRGC sphere,
- Closest political allies include Ahmad Vahidi, the newly appointed IRGC commander; Hossein Taeb, a former head of the IRGC's intelligence organisation; and Mohammad Bagher Ghalibaf, the current speaker of the parliament.

Expediency and entrenchment paved way

- Lacks criteria previously required previously laid out by Ali Khamenei, incl having held some senior elected office.
- Mojtaba's fortunes may have improved with
 - Israeli/US media front-running his election, Trump objecting publicly, and Pezeshkian's "apology" to neighboring states
 - Both events may have served to harden views and provide room for Mojtaba's ascent.

Signal: Continuity and unwavering defiance in existential struggle for survival

- Sends a message that Iran will not back down
- Personal animosity to the US and Israel: many of Mojtaba's family members have been killed in this war.

R. Khomeini
1979-1989

Ali Khamenei
1989-2026

Mojtaba Khamenei
2026-

Security threats

- Israel has threatened to assassinate whoever is selected as the next leader
- The US has warned that the next leader must cooperate or face the same fate as the previous one.

Domestic political implications

- Some media outlets indicate there may have been opposition to Mojtaba:
 - SNSC Secretary Ali Larijani (whose brother Sadeq was an alternative candidate)
 - Ali Khamenei's deputy chief of staff Ali Asghar Hejazi who may be more rooted in non-IRGC intelligence circles
- Candidates may be unwilling to step forth in the middle of a war that has just seen the previous Supreme Leader assassinated.
- The longer the war goes on the higher the likelihood of further leader turnover in Iran.

A New Supreme Leader II: Influential clerics and also-rans

Alireza Arafati – Conservative pragmatist?

- Appointed to temporary council responsible for duties of the Supreme Leader's office after Ali Khamenei's death
- Member of the Guardian Council since 2019, and a member of the Assembly of Experts since 2022.

Sadiq Larijani – the “Borgia” of Iran?

- Chairman of Expediency Discernment Council since 2018, former Chief Justice and former member of the Assembly of Experts
- Brother of Ali Larijani, killed in Israeli strikes in March 2026.
- His appointment would thus strengthen the family's hold of the reins of power in Iran.

Gholamhossein Mohseni-Ejei – The Hardliner

- A product and facilitator of the regime's repressive judicial apparatus. Represents institutional continuity, including balance between IRGC and the clergy.
- Deeply involved in the brutal protest crackdowns of January 2026.

Hassan Rouhani- the Sidelined Reformer

- Former President and widely held reformist politician and cleric
- Could indicate a relatively more constructive political future.
- Sidelined by hardline regime elites since his presidency

Mohammad Mahdi Mirbagheri – The Radical

- Apocalyptic theologian, indicates pivot to even more radical ideological current, associated with the hardliner Paydari faction.
- Head of the Qom Academy of Islamic Sciences and is a member of the Assembly of Experts

Hassan Khomeini – ‘Maverick with pedigree’

- Grandson of the first Iranian supreme leader Ruhollah Khomeini,
- Known for independent opinions that occasionally ran against regime views
- Expressed regime support during January 2026 protest

Source: The above draws on various news reports.

Is there an alternative to the regime?

Stylized scenarios of Iran's political evolution outside of the status quo				
Scenario Name	Core Mechanism	Key Actors & Entities	Geopolitical Implications	Primary Risks & Constraints
 Constitutional Revolution Continued	Pivot toward constitutionalism and democratic representative government.	Pro-democracy activists, reformists, as well as foreign actors' willingness to support Iranian democracy.	Seismic geopolitical event; shockwaves across Middle East autocracies; end of "pariah" status.	Absence of an influential democratic opposition; reliance on symbolic rather than organized leadership.
 'The Man on Horseback'	Secular, progressive military intervention to push toward Western-friendly or neutral trajectory.	Artesh (Conventional Armed Forces), non-clergy political elites, reformists, and activists.	Domestic secularization, possible Western re-alignment	Fragmentation of security forces; opposition from IRGC and Basij; necessity of army leaving barracks.
 Passing the Revolutionary Torch	Shift from clerical rule to a pronounced military dictatorship.	Islamic Revolutionary Guard Corps (IRGC); non-clergy 'principlists'.	Stronger relations with Russia and China; confrontational rhetoric toward the West.	Economically and geopolitically unproductive; minority support (est. 45% of 2024 voters).
 'Claudius from the Clergy'	Regime survival through a change in top leadership/centralization of power.	Upper clergy elites, reformists or pragmatists	Potential for internal reform (though uncertain); maintenance of status quo structures.	Popular and international legitimacy; operational challenges in managing crises.
 Destabilization and Risk of Civil War	Fissuring of the polity leading to incomplete regime change or state failure.	Ethnic minorities (Kurdish, Balochi); external support for anti-regime groups.	Regional instability; ballistic/nuclear proliferation risks; economic collapse.	Institutional failure; emergence of "rump state" vs. fragmented anti-regime zones.

Source: SEB. "Iran is on the brink - but of what?", SEB EM Update, <https://research.sebgroup.com/macro-ficc/reports/70641>. Scenarios are stylized and do not represent forecasts.

Has the killing of Iranian leaders made the regime more hardline?

Decapitating leaders have diminishing returns if it also restricts new leaders' abilities to make peace

- Last week Ali Larijani, who had effectively been running the country during the past couple of months, was killed in an airstrike, alongside the commander of the Basij militia, Gholamreza Soleimani.
- Since then, the head of Iran's intelligence agency, Esmail Khatib, has also been killed.
- These killings serve to disrupt Iran's command and control of the regime but could also allow hardliners within the regime to secure further control.
- Iran has implemented a "mosaic" strategy that decentralizes war operations, and just as with the killing of Ali Khamenei, this is unlikely to bring Iran to the negotiating table.
- Killing leaders could degrade the regime's functions but could also limit the ability of the next leader to push for a peaceful resolution.

Key Iranian leaders and commanders killed in the conflict

Name	Position	Date
1 Ali Khamenei	Supreme Leader of Iran	28/2/26
2 Rear admiral Ali Shamkhani	Secretary of the Iranian Defence Council	28/2/26
3 Maj.Gen. Mohammad Pakpour	Commander of the Islamic Revolutionary Guard Corps	28/2/26
4 Maj.Gen. Abdolrahim Mousavi	Chief of the General Staff of the Iranian Armed Forces	28/2/26
5 Brig.Gen. Aziz Nasirzadeh	Minister of Defence and Armed Forces Logistics	28/2/26
6 Brig.Gen. Mohammad Shirazi	Head of the Military Office of the Supreme Leader	28/2/26
7 Brig.Gen. Hossein Jabal Amelian	Chairman of the Organization of Defensive Innovation and Research (SPND)	28/2/26
8 Brig.Gen. Reza Mozaffari Nia	Former Chairman of the Organization of Defensive Innovation and Research (SPND)	28/2/26
9 Brig.Gen. Mohsen Darrebaghi	Deputy for Logistics and Support, General Staff of Armed Forces	28/2/26
10 Brig.Gen. Gholamreza Rezaian	Commander of Iran's Police Intelligence Organization	28/2/26
11 Brig.Gen. Bahram Hosseini Motlagh	Head of Operations Planning, General Staff of the Armed Forces	28/2/26
12 Mohammad Baseri	Senior Intelligence Ministry official	28/2/26
13 Saleh Asadi	Head of Intelligence Directorate, Khatam-al Anbiya Central Headquarters	28/2/26
14 Brig.Gen. Majid Ebn-e-Reza	Minister of Defence and Armed Forces Logistics	3/3/26
15 Brig.Gen. Gholamreza Soleimani	Commander of the paramilitary Basij forces	17/3/26
16 Brig.Gen. Ali Larijani	Secretary of the Supreme National Security Council	17/3/26
17 Esmail Khatib	Minister of Intelligence	18/3/26
18 Commodore Alireza Tangsiri	Commander of the IRGC Navy	26/3/26
19 Brig. Gen. Mohammad Ali Fathalizadeh	Commander of the Fatehin (IRGC special forces) unit	1/4/26
20 Maj. Gen. Seyed Majid Khademi	IRGC Intelligence Chief	6/4/26

SEB Nordic Outlook May 2026

Energy Theme Chapter

- Elevated global oil inventories have so far cushioned the world from an outright energy crisis while optimism that a reopening of the SoH is imminent has prevented the world from panicking. But the global economy is living on borrowed time. The fundamental situation is deteriorating day by day. Alarm bells will ring loudly in May. And a full-blown crisis is a high risk if the SoH is still not yet open in June or July.

Inflation Theme Chapter

- Rising oil prices quickly lead to higher inflation via increased fuel prices, but also risk pushing up core inflation via more generally rising production costs.
- at broader and larger commodity price increases combined with transport and production problems are required for a more problematic rise in core inflation.

Commodities

Amid disruptions to the Strait of Hormuz, Bab El-Mandeb & the Black Sea, markets dependent on US/China exports/imports

The chart displays three data series: Crude oil in floating storage (grey area), Crude oil in transit (red line), and Crude oil on water (blue line). The Y-axis represents billion barrels, ranging from 0.85 to 1.40. The X-axis shows time from January 2020 to January 2026. The data shows a major peak in early 2020, followed by a sharp decline and subsequent fluctuations. Crude oil in floating storage generally represents the highest volume, while crude oil in transit represents the lowest volume.

Year	Crude oil in floating storage (billion barrels)	Crude oil in transit (billion barrels)	Crude oil on water (billion barrels)
2020	1.35	1.15	1.25
2021	1.05	0.95	1.05
2022	1.15	1.05	1.15
2023	1.25	1.15	1.25
2024	1.15	1.05	1.15
2025	1.35	1.25	1.35
2026	1.25	1.15	1.25

Barrel/day, million

Jan 2025 Apr 2025 Oct 2025 Jan 2026 Apr 2026 Jul 2026

The chart displays the monthly number of tanker transits through the Bosphorus Strait, smoothed with a 1-month moving average (MA). The data spans from May 2019 to May 2026. The y-axis, labeled 'Number', ranges from 15 to 28. The x-axis shows months (M, S, J, M, J, S) for each year. The transits are highly volatile, with peaks reaching nearly 28 in mid-2023 and troughs falling below 20 in early 2022 and early 2026.

EIA: Hormuz constraints persist, disruptions last into 2027

EIA's latest Short-Term Energy Outlook estimates that...

- Regional production shut-ins averaged 5.5 million b/d in July
- Global oil inventories fell by an average of 4.2 million b/d in 2Q26 and will fall by an additional 3.8 million b/d on average in 3Q26.
- EIA forecasts Brent crude oil spot price will average around \$85/b in 3Q26, \$11/b higher than in last month's STEO.
- Once the traffic through the Strait of Hormuz gradually increases and shut-in oil production increasingly restarts, EIA forecast oil prices will begin to fall, decreasing to an average of \$78/b by 4Q26.
- EIA assesses that most shut-in oil production will be largely restored in 1Q27 and that global oil inventories will again start building, gradually lowering oil prices to an average of \$69/b in 2027.

SEB Commodities Monthly (30 April)

The world is living on borrowed time until the Strait of Hormuz is reopened

Every week of delay beyond 1 May adds theoretically ~5/bl to the rest-of-year avg. as inventories draw ~100 mb per week.

- A mid-May reopening implies rest-of-year Brent near \$100/bl;
- June pushes us into uncomfortable territory;
- July risks a full-blown crisis where the world is forced to align consumption with availability.

Our 1 April call of \$95/bl for 2026 was above the curve at the time. The market has caught up.

- A reopening in early June rather than mid-May puts another \$10/bl on the 2026 avg. taking us towards \$105/bl.

Base case unchanged for now, yet the risks are firmly to the upside.

- Another 8+ weeks of further delay pushes Brent to \$150- 200/bl as cumulative loss exceed 1.5 bn bl.
- Possible damage to the East-West pipeline, the Abqaiq (7 mbl/d) or further LNG trains at Ras Laffan = extending disruption by quarters, not weeks.

The market is now living on borrowed time(!)

Petrochemical value chain

Feedstock

- Natural gas, condensates (a by-product of gas distillation), and naphtha (obtained through the distillation of crude oil).

Upstream Petrochemical (precursors)

- Olefins: methane, ethylene, propylene, and “mixed C4” chemicals.
- Aromatics: such as benzene, toluene, and xylene, serve as inputs in the production of various other petrochemical products.

Intermediate Petrochemical

- E.g. vinyl chloride and styrene

Downstream Petrochemical

- Plastic resin
- Synthetic fibers
- Synthetic rubber elastomers
- Synthetic coatings and adhesive materials

Feedstocks and Petrochemicals

Naphtha - dominant cracker feedstock, simultaneously generates all three olefins (ethylene, propylene, butadiene) and aromatics precursors in a single pass

Natural Gas Liquids (NGLs) - hydrocarbons extracted from natural gas streams

- **Ethane** - Lightest NGL; almost exclusively cracked into ethylene in steam crackers
- **Propane** – Petrochemical feedstock and traded as liquid petroleum gas (LPG)
- **Butane** – Petrochemical feedstock and traded as liquid petroleum gas (LPG)

Olefins - building blocks of plastics and synthetic materials.

- **Ethylene** - Highest-volume petrochemical globally; polymerises into polyethylene (PE), also used for PVC, PET
- **Propylene** - Polymerises into polypropylene (PP); also used for acrylics and epoxies
- **Butadiene** - Key monomer for synthetic rubber (SBR, polybutadiene); extracted from C4 cracker streams
- **Styrene**

Aromatics - primarily used for fibres, resins, and plastics

- **Benzene** - Simplest aromatic; feedstock for styrene, nylon, polycarbonate
- **Paraxylene** - Oxidised into purified terephthalic acid (PTA), which is then polymerised into PET — the resin in plastic bottles and polyester fibres
- **Orthoxylene** - Tyres (SBR), plastics (PS, ABS)
- **Toulene** - Third BTX pillar; polyurethane chain (TDI)

The Donkey Doctrine Ate the Carter Doctrine

RIP The Carter Doctrine

The Carter Doctrine was a U.S. foreign policy declared by President Jimmy Carter in his 1980 State of the Union Address.

The US would use military force, if necessary, to defend its vital national interests in the Persian Gulf, particularly against any attempt by an outside power to gain control of the region's oil-rich resources.

Facilitated the creation of the Rapid Deployment Forces, boosted military spending, cemented alliances in the region.

The Iran War has inverted several key pinnacles of the doctrine.

Eroding Deterrence

The Iran War may have substantially reduced US deterrence toward Iran.

Fear of large-scale military campaign may have historically contributed to Iran not openly advancing nuclear weapons.

Iran has now endured precisely such a confrontation and survived it, and any plausible deal may end up a humiliation for Trump and the US.

Whereas pre-2026 ambiguity over US intervention may have boosted deterrence, the latest conflict has demonstrated the US reluctance to commit significant ground forces, constraints on advanced munitions, as well as the limits to which Israel can act independently of US military support.

The Genie is Out Of The Chokepoint

The recent conflict may have convinced the Iranian regime that its ability to disrupt the SoH and targeting energy infrastructure provides coercive leverage that its enemies are ultimately unable to counter effectively.

Actors in other parts of the world may now be preparing contingencies for harnessing nearby chokepoints to further national interests.

The Donkey Doctrine may ultimately leave energy infrastructure around the world, as well as freedom of navigation, more vulnerable.

The Next War Will Be Harder

Global stockpiles of air interceptors, advanced standoff munitions have been depleted, amid limited production capacity to reach pre-war levels. This risks constraining air defense capabilities of Ukraine as well as US partners in East Asia.

A democratization of warfare has reduced inequities, demonstrating that middle powers like Iran and Ukraine can withstand greater powers like Russia and the US using new technologies, drones, asymmetric warfare, and strategic use of geography.

Powers perceiving risk of future US military intervention may rush to emulate Iran's military strategy, reducing the efficacy not just of US military interventions, but also broader power projection.

Alienating partners

The Iran War has demonstrated to especially Gulf states that hosting US military bases does not ensure security. US limited security commitments, coupled with Iran power projection, could shift national security calculations.

The Iran War exposed allied economies to Iranian strikes, while the US has pressured for economic and diplomatic concessions,

This could open for reduced US military base presence in the region, amid reduced partner's commitments to the US relationships.

Geopolitical balance tilts in rivals' interests

The Donkey Doctrine puts the security of the global oil economy at risk. Even if the SoH reopens, markets will remain on edge without a durable diplomatic deal.

Lingering geopolitical risk premia in oil markets benefit Russia and other autocracies producing oil and natural gas.

In the longer term, the Donkey Doctrine may herald greater uncertainty over the stability of these natural sources.

As a result, more countries may pursue alternatives, including clean energy technologies where China has a significant advantage.

Expended US Munitions May Take Years To Replenish

Recent CSIS [report](#) indicate replenishing US munitions expended in the Iran War may take years to replenish.

- The US may have enough munitions for any plausible scenario in the Iran war,
- ... but the **depleted inventories have created a window of vulnerability for a potential Indo-Pacific conflict.**
- The time needed to rebuild those inventories has thus become a major concern.

Examples:

- Land Attack Missile (TLAM), Terminal High Altitude Area Defense (THAAD), and Patriot—heavily used in this war—will take 3+ years to return to prewar inventory levels.
- Naval missiles not used as heavily, such as Standard Missiles (SM-3 and SM-6) will take around 2 years.
- Joint Air-to-Surface Standoff Missile (JASSM) and Precision Strike Missile (PrSM) will take several months to a year to replace. The prewar PrSM inventory was low because the system had just begun production. JASSM, though heavily used, will see large deliveries from recent procurements.

Munition	Estimated use in Iran War	Estimated return to prewar inventory
Tomahawk	1,000+	Late 2030–early 2031
THAAD	190–290	Mid to late 2029
Patriot	1,060–1,430	Mid-2029
SM-3	130–250	Early 2029
SM-6	190–370	Late 2028–early 2029
JASSM	1,100+	Mid-2027
PrSM	40–70	Late 2026

Iranian attacks caused significant damage to US military bases

Iran attacks caused damage to US military bases that was "far worse than acknowledged" ([NBC News](#), Apr 25)

Cost of Iranian strikes estimated at USD 40-50bn ([CNN](#), Apr 30):

- Iranian strikes significantly damaged at least 9 US military sites in just the first 48 hours, hitting facilities in Bahrain, Kuwait, Iraq, the UAE, and Qatar,
- the Pentagon's stated USD 25bn war cost to be a lowball that excluded base reconstruction — with real estimates closer to \$40–50 billion.

After rebuilding and repairs, US military force posture across the Middle East is likely to shift and shrink overall ([AEI](#), Apr 28)

At least 228 structures or pieces of equipment at US military sites were damaged ([WaPo](#), May 6)

- The investigation identified 217 damaged or destroyed structures and 11 damaged pieces of equipment — including hangars, barracks, warehouses, fuel depots, aircraft, radar systems, communications sites and air defense assets — across 15 US military sites in Kuwait, Bahrain, Qatar, Jordan, Saudi Arabia, and the UAE.

Iran has damaged 20 US military sites since the start of the war, satellite images and videos analyzed by [BBC Verify](#) show.

- The US has sought to limit satellite analysis of the conflict by requesting Planet, a major provider, to impose an "indefinite" restriction on new images of Iran and most of the Middle East.

Damage to US Military Bases in the 2026 Iran War

Country	Base	Estimated Damage
Bahrain	5th Fleet Headquarters	2 SATCOM terminals, 2 radomes, and 3 large warehouses
Iraq	Erbil Military Base	1 storage building
Jordan	Muwaffaq Salti Air Base	1 general administrative building
Kuwait	Ali Al Salem Air Base	3 hangars, parts of the runway, 15 small warehouses, 1 maintenance shed
Kuwait	Camp Arifjan	6 radomes, 4 small and large warehouses, 1 general administrative building, 1 maintenance shed
Kuwait	Camp Buehring	1 SATCOM terminal, 1 hanger, 4 small and large warehouses
Kuwait	Shuaiba Port	1 general administrative building
Qatar	Al Udeid Air Base	Parts of the runway
Saudi Arabia	Prince Sultan Air Base	1 small warehouse, 1 radome
UAE	Al Dhafra Air Base	2 general administrative buildings, 2 small hangars, 1 medical clinic, 6 fuel storages, 1 barracks
UAE	Al Ruwais Military Base	5 small warehouses, 2 general administrative buildings

Trump's Lessfires Have Failed to Stabilize the Middle East

- Trump's ceasefires in Gaza, Lebanon, and with Iran have not produced cessation of hostilities: all three fronts remain active and should rather be considered lessfires.
- Notwithstanding an emerging narrative of US strategic defeat, the current equilibrium is also eroding Iran's key strategic assets — particularly its grip on the Strait of Hormuz — while entrenching military institutions at the expense of civilian ones, with significant bearing on post-conflict Iran's political economy.
- Dynamics often portrayed in western media as divisions within the Iranian regime may instead point to an emerging strategic view of diplomacy as less effective at securing national security without a greater willingness and capacity to use military force.
- What happens in Lebanon now matters for global markets: the Israel–Hezbollah conflict runs in parallel with its own logic and has already demonstrated its capacity to derail regional diplomacy.
- Both sides can exploit the current situation: Iran can use Hezbollah to pressure Trump into restraining Israel; the US can use Israeli latitude to accelerate Hezbollah attrition and squeeze Tehran.
- The devolution of power to regional actors are an inherent consequence of diminishing US power in the region
- The base case remains a "skinny" deal deferring core disagreements, but the tail risk of uncontrolled escalation — driven by Iranian internal pressure, Israeli initiative, or a spoiler dynamic neither side fully controls — poses heightened adverse risks to market pricing.

Embargo on exports imply storage and productions constraints

Iran has substantial but limited crude inventories

- Estimates of Iran's storage space range from 20-35mb left of crude oil storage space
- and may therefore have roughly 2-3 weeks before it is forced to reduce production.
- Crude inventory space may last longer but cuts would need to occur before all inventory space has run out, and curtailments may need to start as early as in a week or so.

Domestic demand is roughly 1.5m bpd, and there may be a fraction of excess oil that can be exported via land

- Still, losing close to 1.6m bpd would be a challenge to Iran's external balance, as well as for the Iranian regime's rent extraction system.

While Iran thus has the latitude to divert stranded output from Kharg Island to less full facilities, Tehran may still opt to aggressively curtail production so that it has relatively ample spare storage capacity after the shut-in and to allow for a smoother restart of production once conditions permit.

Counting the costs of war in Iran

NYT: early estimates of the cost of war are between \$300 billion and \$1 trillion (The IMF estimate for Iran's 2025 USD GDP was \$371.2bn.)

Cumulative output losses are

- 33% of 2025 GDP comparing latest Apr '26 WEO forecast with the Oct '25 vintage.
- 10% of the 2025 GDP level as per the Apr '26 WEO forecast

Iran's central bank has reportedly warned the government that the economy may take up to 12 years to rebuild after the war.

Environmental damage to compound accumulated economic challenges

The War has damaged...

- .. more than 125,000 residential and civil buildings, including 339 health facilities, 32 universities, and 857 schools, and has directly destroyed over 20,000 industrial units
- Around 20 percent of the country's "production units" have been directly damaged.
- Iran's ports and transportation systems, which move essential goods and raw materials across the country, have also been heavily damaged.
- About 10 to 12 million jobs, roughly 50 percent of Iran's workforce, are now at risk of furloughs or layoffs.

Iran – Record-high inflation and falling exchange rate

Annual headline (food) inflation in July reached 89% (134%)
